25

Claims:

of clothing, especially a pair of pants, to a transverse support (27), which connects the ends of a clothes hanger (20) and has a middle reinforced region (15, 26) and two outer leaf spring elements (11, 12, 28, 29), characterized in that it is made entirely of plastic.

- 10 2. The clamping element (10, 21) of claim 1, characterized in that the leaf spring elements (11, 12, 28, 29) have a thickness that varies over their length.
 - 3. The clamping element (10, 21) of claim 1 or 2, characterized in that the leaf spring elements (11, 12, 28, 29) protrude into the reinforced middle region (15, 26).
 - 4. The clamping element (10, 21) of claim 1-3, characterized in that the leaf spring elements (11, 12, 28, 29) have a curvature, so that at the connecting points (16, 17, 22, 23) to the clothes hanger (20) they have an angle of inclination of preferably 1 -95 relative to the horizontal.
 - 5. The clamping element (10, 21) of claim 1-4, characterized in that on both ends it has a respective joint element (16, 17, 22, 23) for articulated connection to the clothes hanger (20).
- 6. The clamping element (10, 21) of claim 1-5, characterized in that it is made from plastic, preferably POM, polycarbonate, or impact resistance modified polystyrene.
- 7. The clamping element (10, 21) of claim 1.5,
 35 characterized in that it is made of a glass fiber reinforced plastic, such as POM-GF.

5

- 8. The clamping element (10, 21) of claim 1-5, characterized in that it is made of an amorphous plastic.
- 9. The clamping element (10, 21) of claim 1-8, characterized in that it is made in a single operation.
- 10. The clamping element (10, 21) of claim 1-9, characterized in that the reinforced middle region (15, 26) and the leaf spring elements (11, 12) are embodied as a one-piece injection-molded part.
